CIFAR

Overview

- Meta learning
- Recurrent Inference Machine
- Application radio astronomy
- Application to MRI
- Conclusions

Motivation

MRI-Guided Radiation Therapy

The promise of real-time visualization during radiotherapy treatment is pushing science and industry to develop exciting new advances in this cutting-edge technology

▼
Elekta's MR-linac combines two technologies — an MRI scanner and a linear accelerator — in a single system. This allows physicians to precisely locate tumors, tailor the shape of X-ray beams and accurately deliver doses of radiation even to moving tumors.

Learning to learn by gradient descent by gradient descent

2016

brendan.shillingford@cs.ox.ac.uk, nandodefritis@google.com

- Train an optimizer to choose the best parameter updates by solving many optimization problems and learn the patterns.
- Unroll gradient optimizer, then abstract into a parameterized computation graph, e.g. RNN

$$\theta \leftarrow \theta + \eta_t \nabla_{\theta} F(\theta)$$

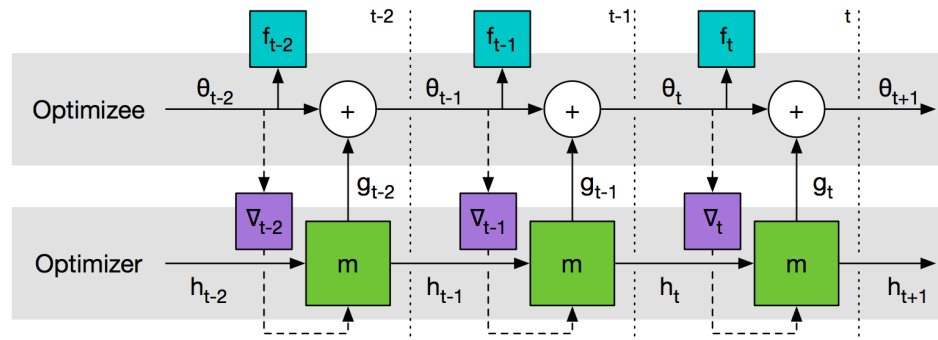

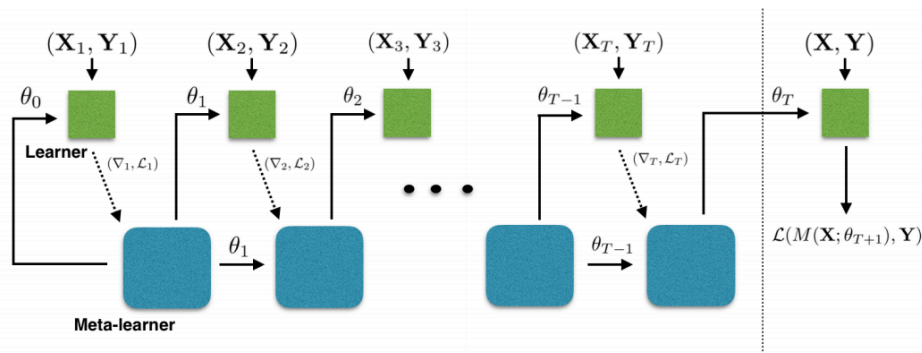

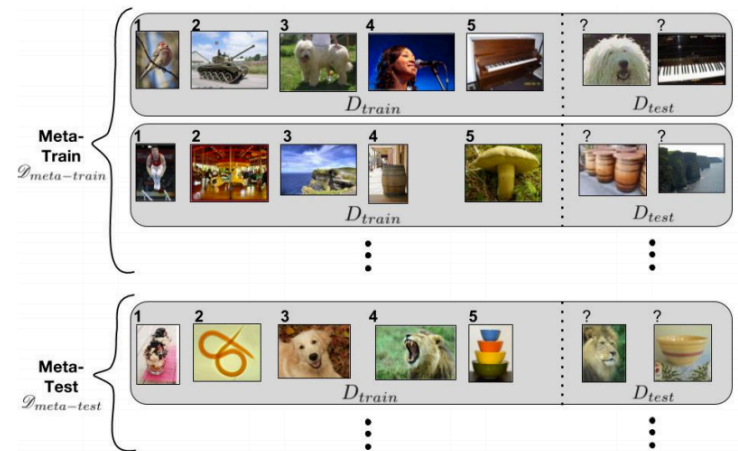

Figure 2: Computational graph used for computing the gradient of the optimizer.

OPTIMIZATION AS A MODEL FOR FEW-SHOT LEARNING

2017

hyperparameter optimization
Maclaurin et al. '15

learned recurrent cell
Zoph & Le '17

few-shot image classifier
Vinyals et al. '16

learning to quickly navigate new mazes
Duan et al. '16

Various recent meta-learning approaches.

The Recipe

- Study the classical iterative optimization algorithm
- Unroll the computation tree and cut it off at T steps (layers)
- Generalize / parameterize the individual steps
- Create targets at the last layer
- Backpropagate through the "deep network" to fit the parameters

- Execute the network to make predictions

Learning to Infer

- Unroll a known iterative inference scheme (e.g. mean field, belief propagation)
- Abstract into parameterized computation graph for fixed nr. iterations, e.g. RNN
- Learn parameters of RNN using meta-learning (e.g. solving many inference problems)

Inverse Problems

w/ Patrick Putzky

Quantity of interest

Measurement

Forward Model

$$\mathbf{y} = g(\mathbf{x}) + n$$

Inverse Model

$$\hat{\mathbf{x}} = h(\mathbf{y})$$

The Usual Approach

$$L(X) = \log P_A(Y|X) + \log P_\theta(X)$$

$$Y = A \cdot X + \eta$$

prior (learn)

observations

generative model (known)

$$X_{t+1} = X_t + \alpha_t (\nabla_X \log P_A(Y|X_t) + \nabla_X \log P_\theta(X_t))$$

advantage: model $P(X)$ and optimization are separated.

disadvantage: accuracy suffers because
model and optimization interact...

Learning Inference: Recurrent Inference Machine

$$\eta_{t+1} = \eta_t + \gamma_t(\nabla_{y|\eta} + \nabla_{\eta})$$

$$\eta_{t+1} = \eta_t + h_{\phi}(\nabla_{y|\eta}, \eta_t, \mathbf{s}_t)$$

- Abstract and parameterize computation graph into RNN
- Integrate prior $P(X)$ in RNN
- Add memory state s
- Meta learn the parameters of the RNN

Recurrent Inference Machine (RIM)

Learn to optimize using a RNN.

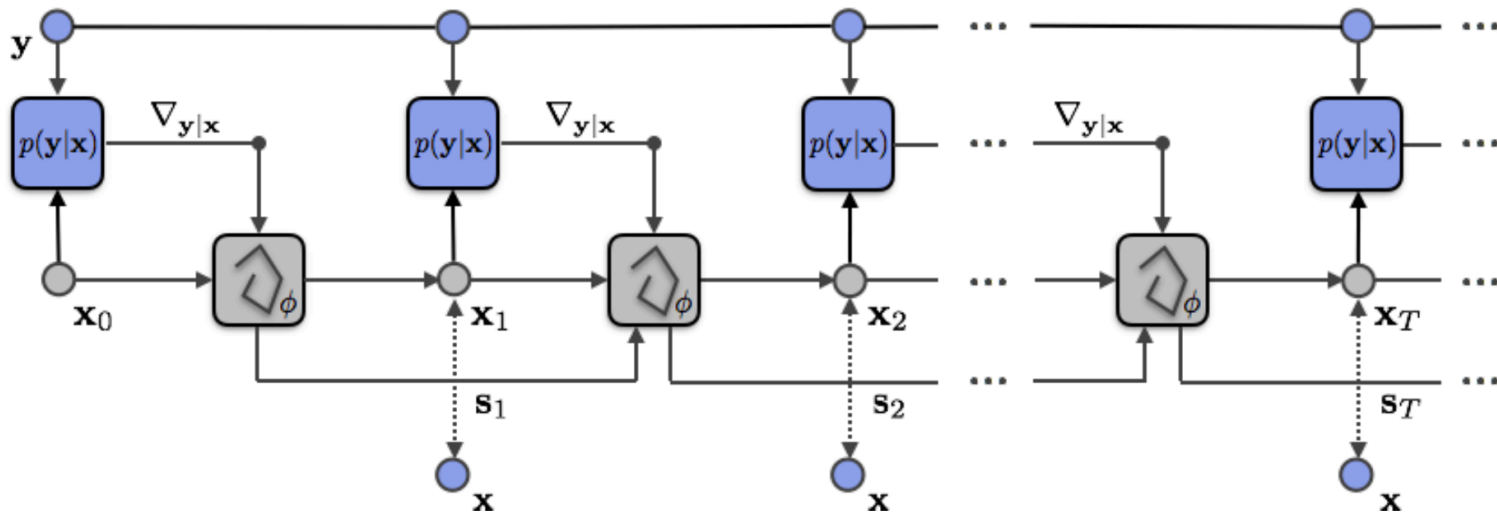

$$X_{t+1} = F_{\theta}(X_t, \nabla_x \log P_A(Y|X_t), S_t)$$

$$S_{t+1} = G_{\nu}(X_t, \nabla_x \log P_A(Y|X_t), S_t)$$

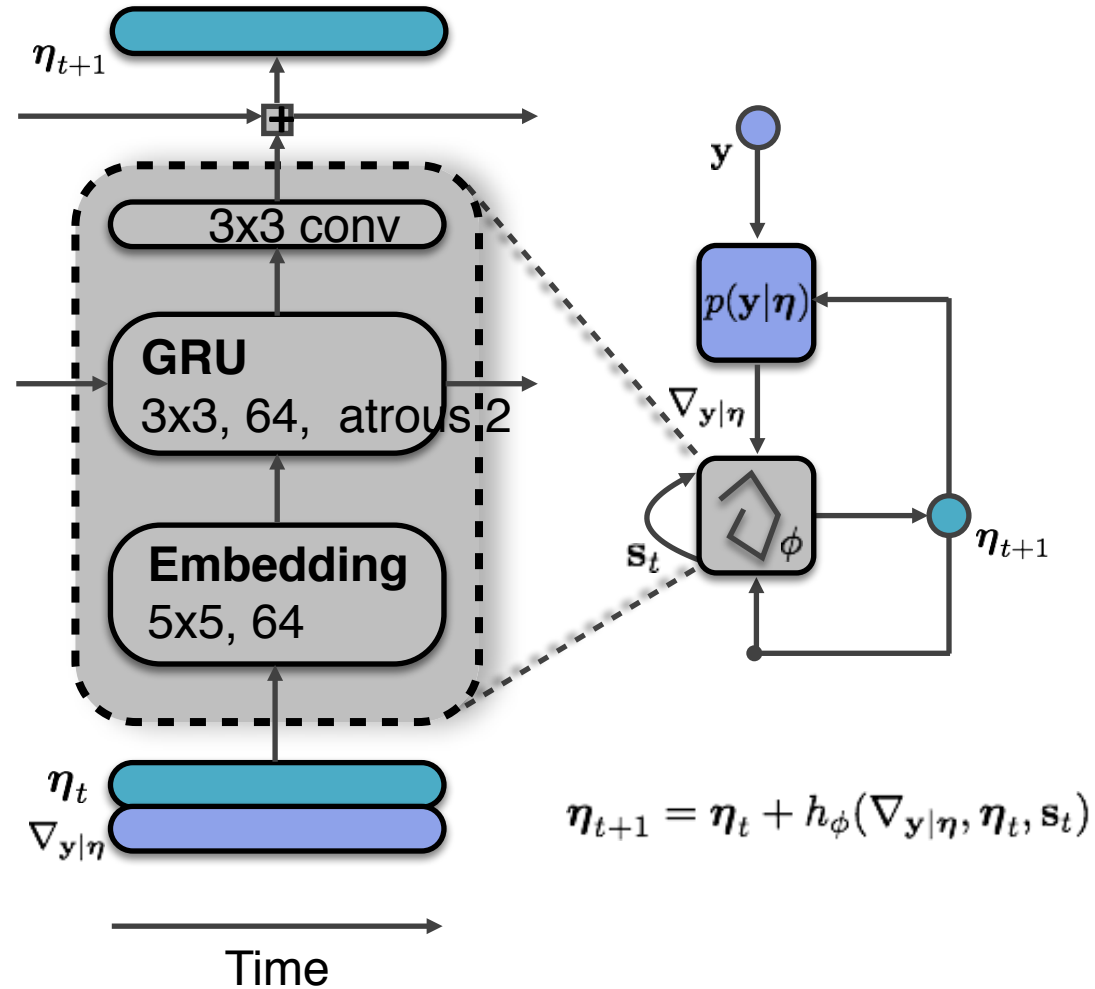

CNN/RNN

external information

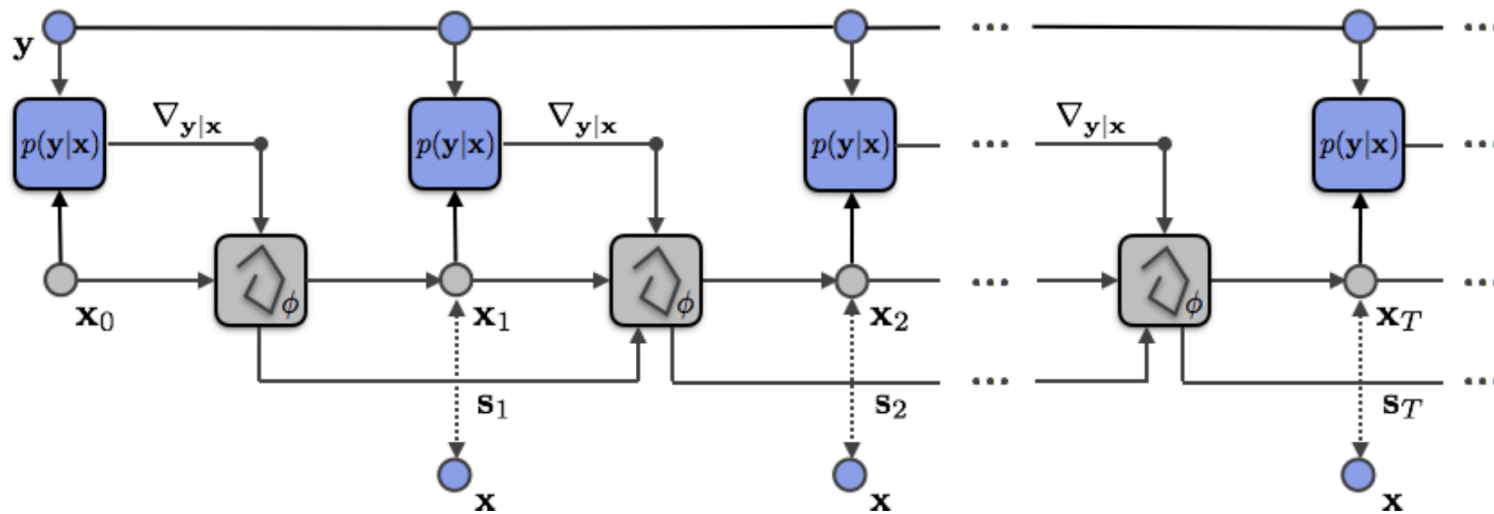

memory state

Recurrent Inference Machine

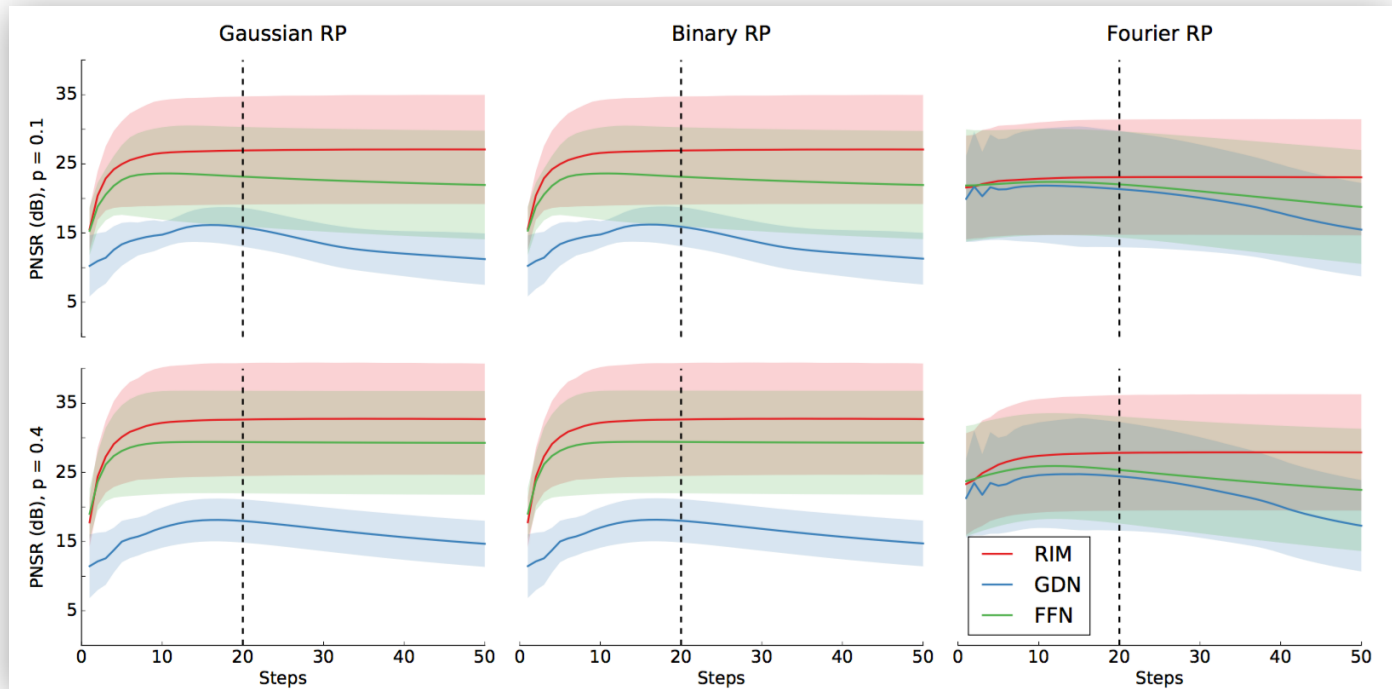

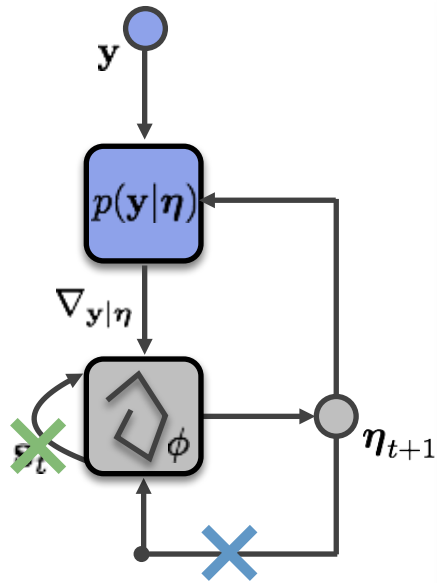

Recurrent Inference Machines in Time

Objective
$$g(\phi) = \frac{1}{2} \sum_{i=1}^N \sum_{t=1}^T (\mathbf{x}^{(i)} - \hat{\mathbf{x}}_t^{(i)})$$

Deep Learning for Inverse Problems

w/ Kai Lonning & Matthan Caan

E.g. MRI Image Reconstruction

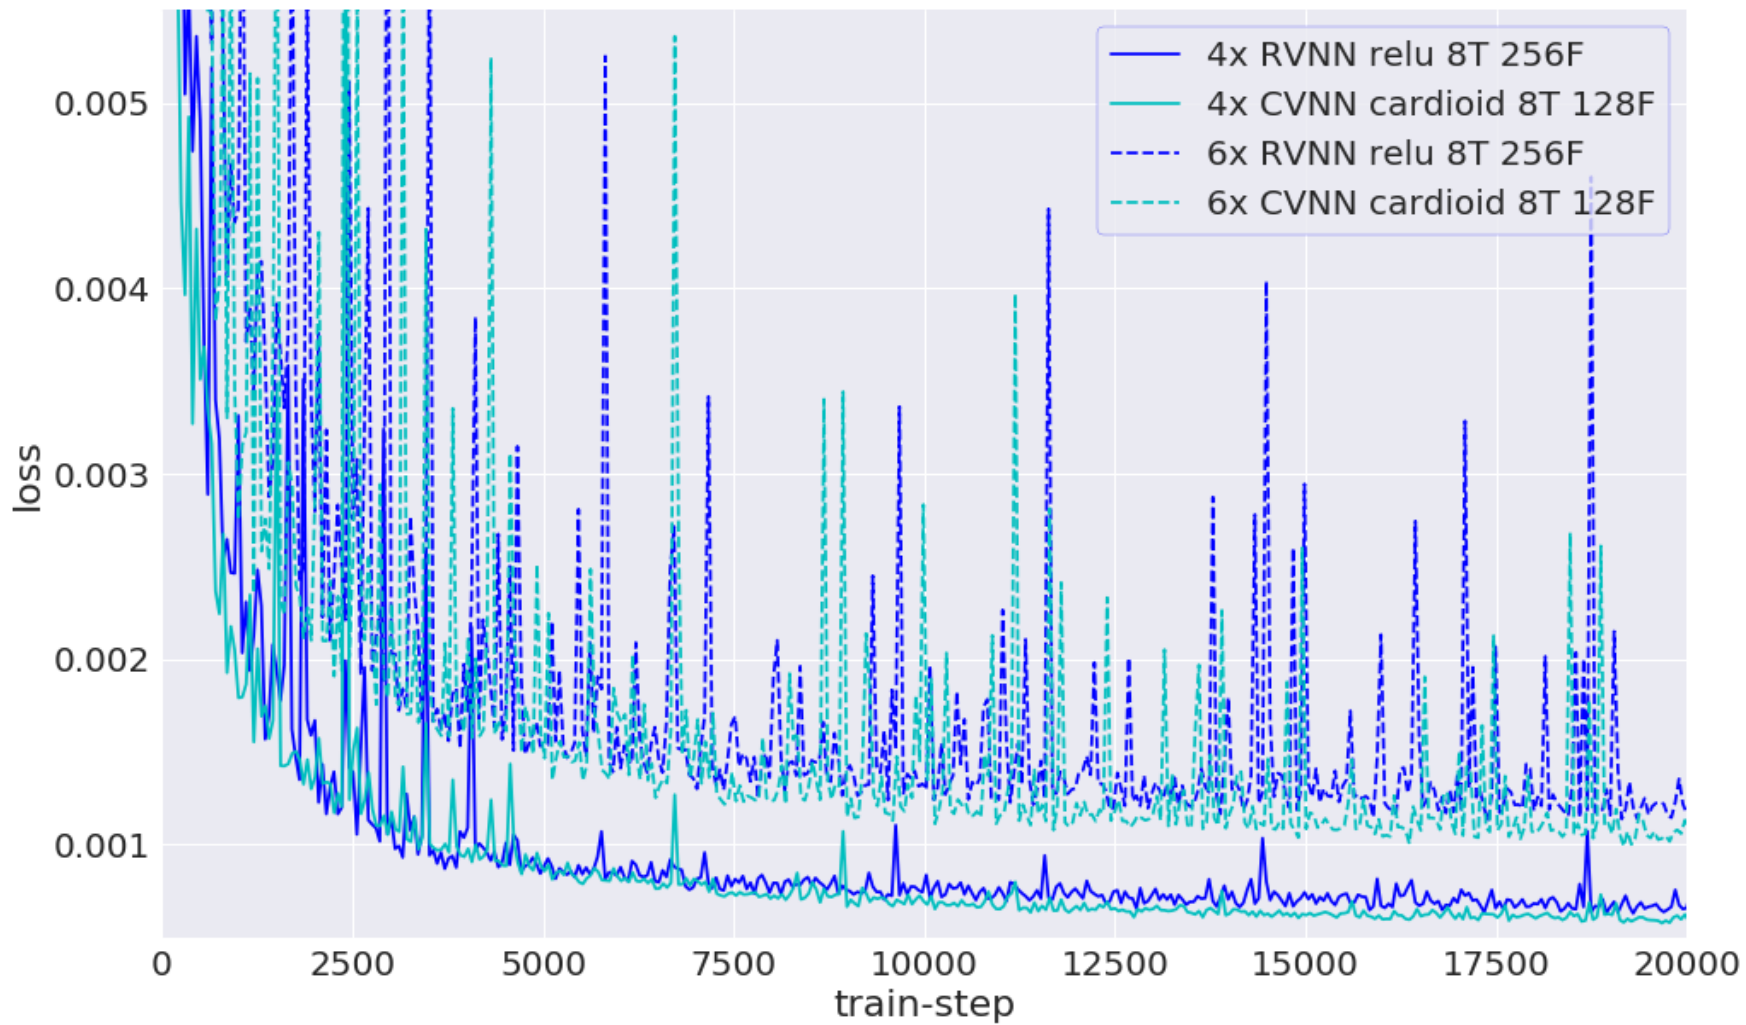

Example of training data
point, 30x30 image patch

Testing done on full images, sub-
sampling masks shown for 6x, 4x
and 2x acceleration

RIM test curves

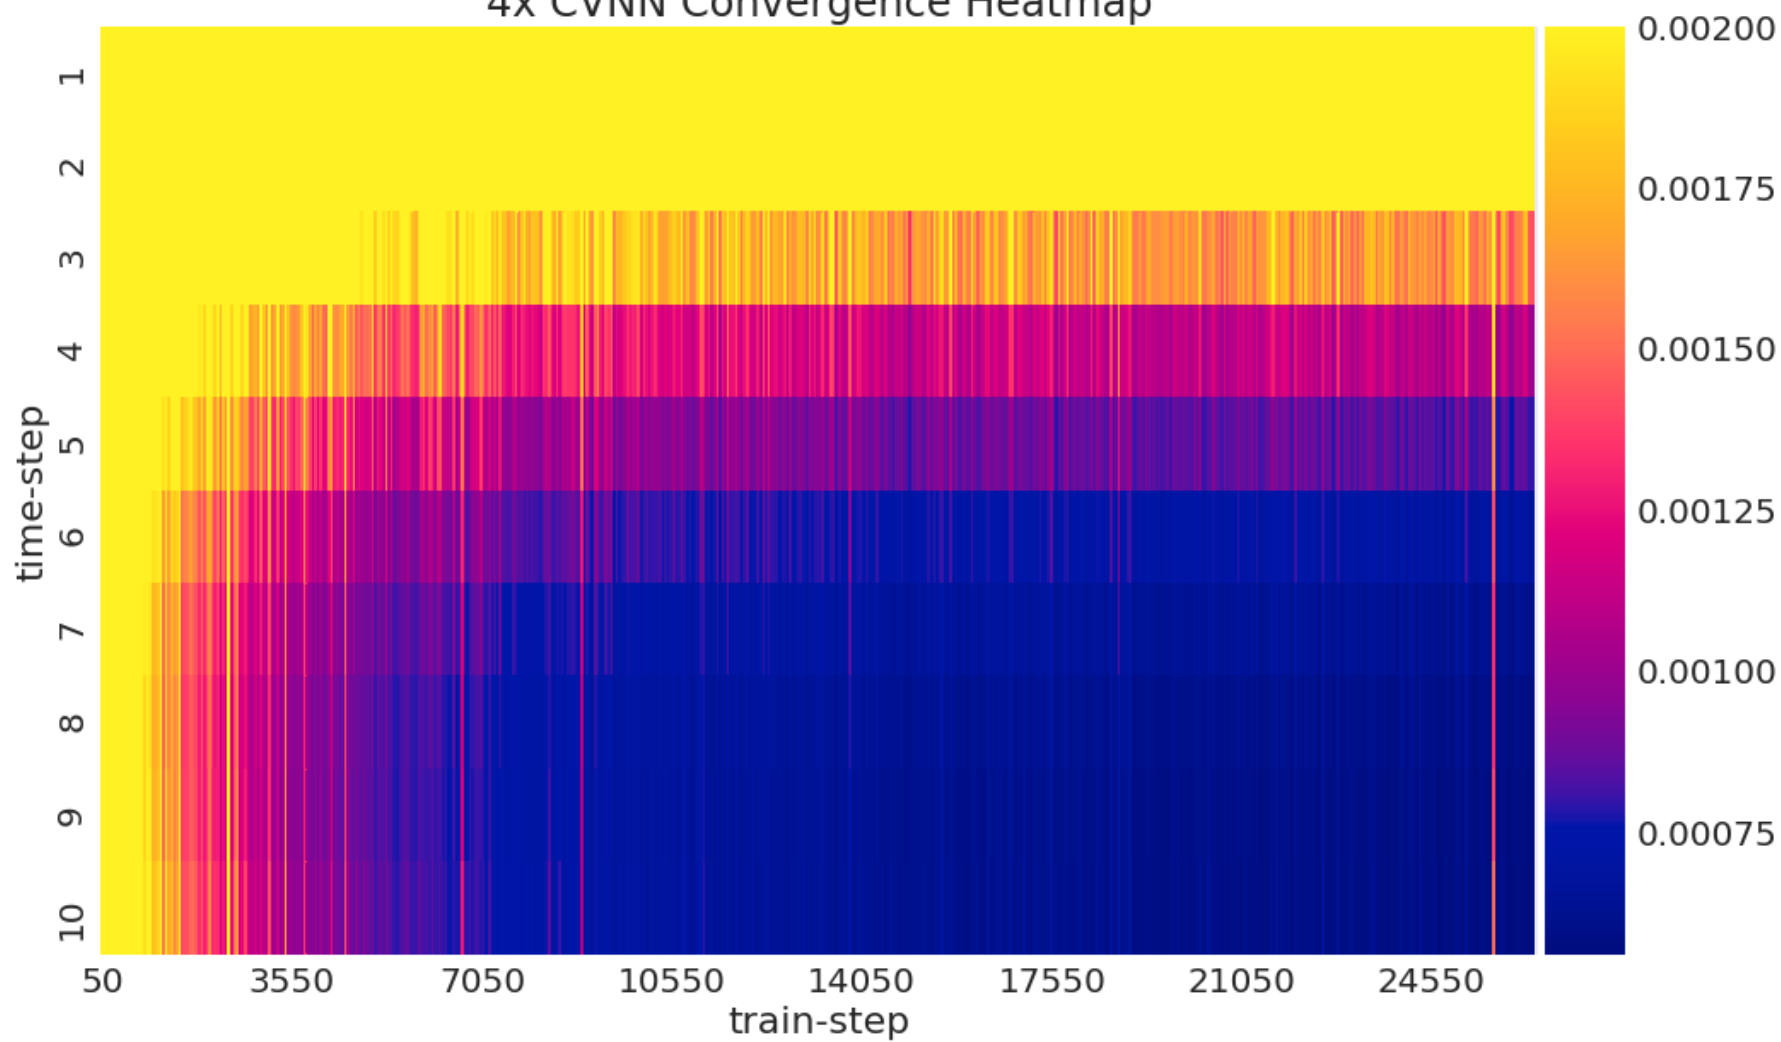

A full brain RIM reconstruction, starting from the 4 times sub-sampled corruption on the left, attempting to recover the target on the right.

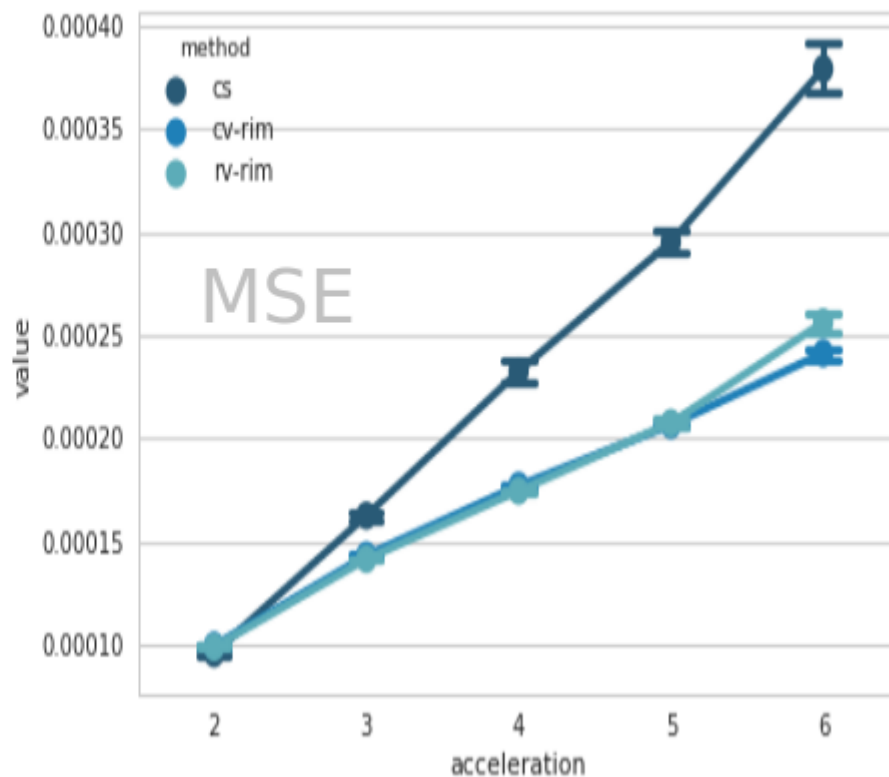

Each time-step in the Recurrent Inference Machine produces a new estimate, here shown to the left, from the 3x accelerated corruption until the 10th and final reconstruction. Target is in the middle, while the error (not to scale) is shown to the right.

4x CVNN Convergence Heatmap

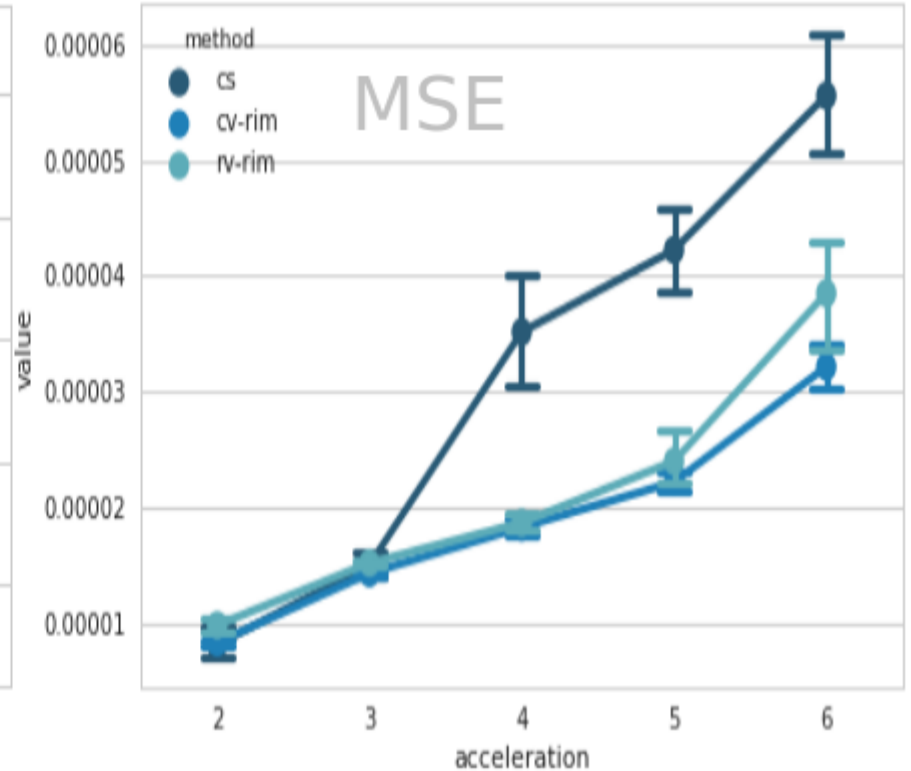

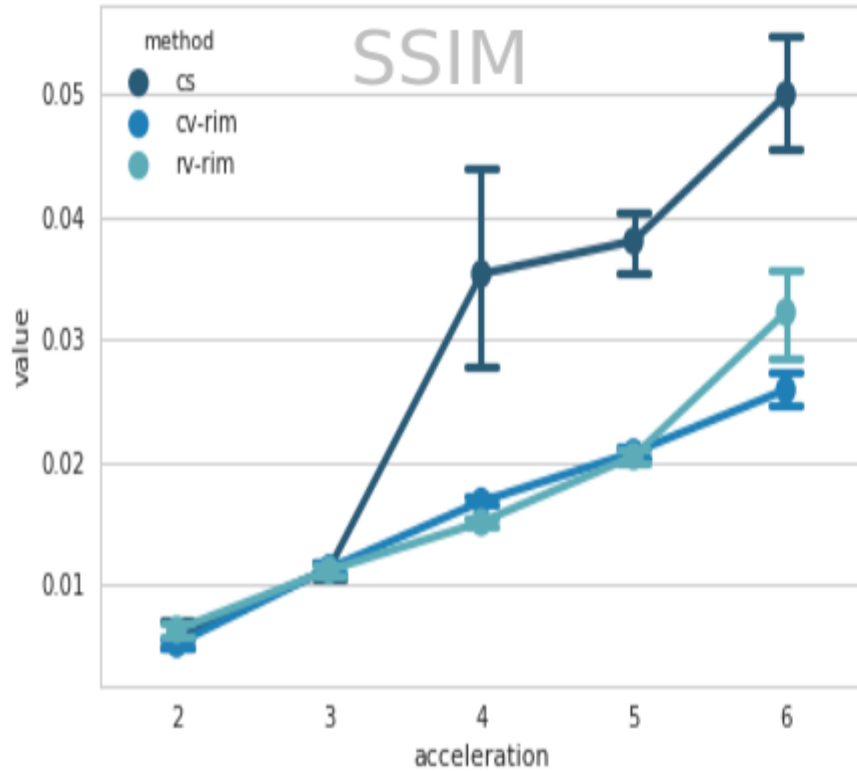

Average across sub-sampling patterns

Std across sub-sampling patterns

Conclusions

- Meta learning is interesting new paradigm that can improve classical optimization and inference algorithms by exploiting patterns in classes of problems.
- RIM is a method that unrolls inference and learns to solve inverse problems.
- Great potential to improve & speed up radio-astronomy and MRI image reconstruction.

MRI-Guided Radiation Therapy
